

Geographic Information System-Review of Applications

Ashok Kumar Sharma,

M. Tech(Structure), Technical Adviser, Lion Group, Bhopal(MP), India

Email ID: aksdarshan348@gmail.com

Abstract: This paper explores and reviews, the various application of **Geographic Information System, GIS** is a computer system build to capture, store, manipulate, analyse, manage and display all kinds of spatial or geographical data. GIS application are tools that allow end users to perform spatial query, analysis, edit spatial data and create hard copy maps. In simple way GIS can be define as an image that is referenced to the earth or has x and y coordinate and it's attribute values are stored in the table. These x and y coordinates are based on different projection system and there are various types of projection system. Most of the time GIS is used to create maps and to print. To perform the basic task in GIS, layers are combined, edited and designed.

GIS can be used to solve the location based question such as “What is located here” or Where to find particular features? GIS User can retrieve the value from the map, such as how much is the forest area on the land use map. This is done using the query builder tool. Next important features of the GIS are the capability to combine different layers to show new information. For example, you can combine elevation data, river data, land use data and many more to show information about the landscape of the area. From map you can tell where is high lands or where is the best place to build house, which has the river view. GIS helps to find new information. Geographical Information System (GIS) are becoming more widely used in transportation planning agencies, especially among metropolitan transportation organizations. GIS offer transport planners a medium for storing and analysing data on population densities, land uses, travel behaviour, etc.

Keywords: GIS, Applications, transportation, natural resources management, environment,

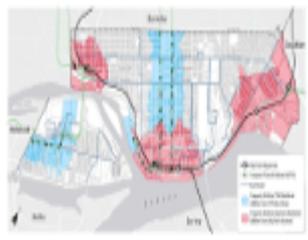

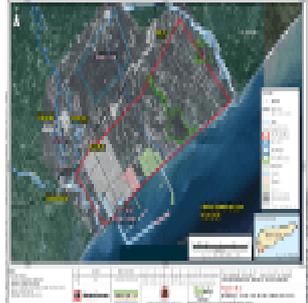

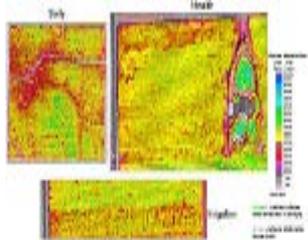

1. APPLICATIONS OF GIS

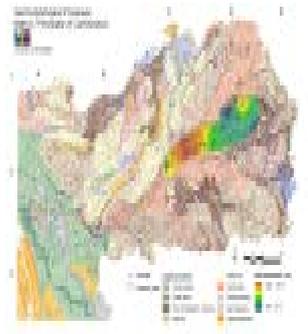

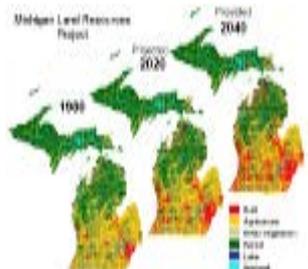

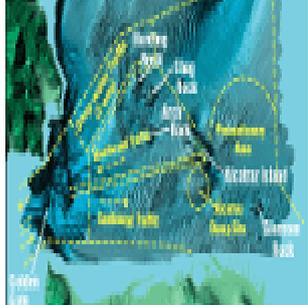

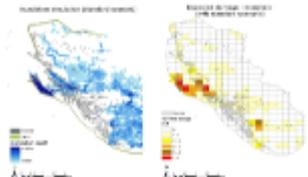

Geographic Information System (GIS) is integral to Planning, Decision Making & Electronic Delivery of Services. It geo-enables e-Governance to facilitate location based information for all. Thus, implementation of GIS based Decision Support Systems (DSS) is essential for ushering ‘Good Governance’ as it facilitates transparency, responsiveness, efficiency & effectiveness, accountability and participation across Government.

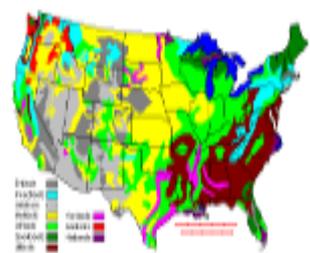

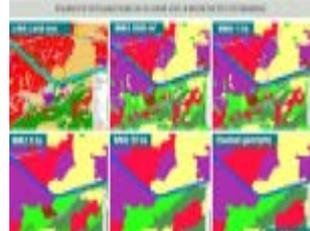

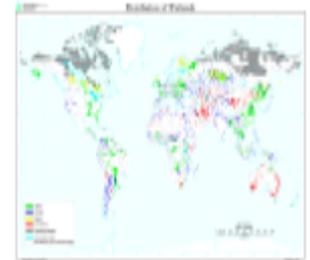

1.10. GIS in Mapping: Mapping is a central function of Geographic Information System, which provides a visual interpretation of data. GIS store data in database & then represent it visually in a mapped

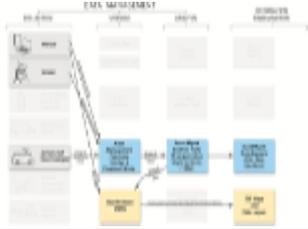

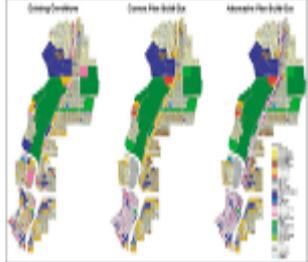

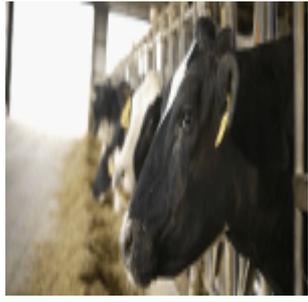

format. People from different professions use map to communicate. It is not necessary to be a skilled cartographer to create maps. Google map, Bing map, Yahoo map are the best example for web based GIS mapping solution.

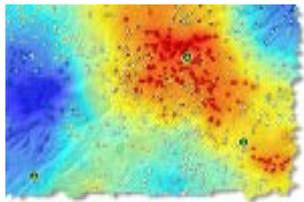

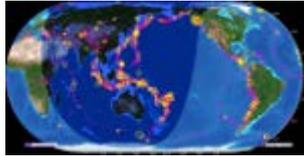

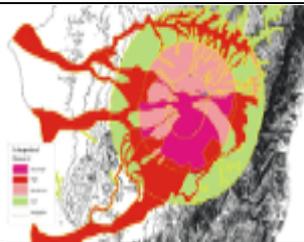

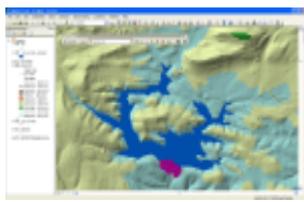

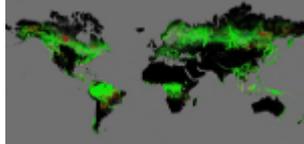

<p>1.11. Telecom and Network services: GIS can be a great planning and decision making tool for telecom industries. enables wireless telecommunication organizations to incorporate geographic data in to the complex network design, planning, optimization, maintenance and activities. This technology allows telecom to enhance a variety of application like engineering application, customer relationship management and location based services.</p>	
<p>1.12. Accident Analysis and Hot Spot Analysis: GIS can be used as a key tool to minimize accident hazard on roads, the existing road network has to be optimized and also the road safety measures have to be improved. This can be achieved by proper traffic management. By identifying the accident locations, remedial measures can be planned by the district administrations to minimize the accidents in different parts of the world. Rerouting design is also very convenient using GIS.</p>	
<p>1.13. Urban Planning: GIS technology is used to analyse the urban growth and its direction of expansion, and to find suitable sites for further urban development. In order to identify the sites suitable for the urban growth, certain factors have to consider which is: land should have proper accessibility, land should be more or less flat, land should be vacant or having low usage value presently and it should have good supply of water.</p>	
<p>1.14. Transportation Planning: GIS can be used in managing transportation and logistical problems. If transport department is planning for a new railway or a road route then this can be performed by adding environmental and topographical data into the GIS platform. This will easily output the best route for the transportation based on the criteria like flattest route, least damage to habitats and least disturbance from local people. GIS can also help in monitoring rail systems and road conditions.</p>	
<p>1.15. Environmental Impact Analysis: EIA is an important policy initiative to conserve natural resources and environment. Many human activities produce potential adverse environmental effects which include the construction and operation of highways, rail roads, pipelines, airports, radioactive waste disposal and more. Environmental impact statements are usually required to contain specific information on the magnitude and characteristics of environmental impact. The EIA can be carried out efficiently by the help of GIS, by integrating various GIS layers, assessment of natural features can be performed.</p>	
<p>1.16. Agricultural Applications: GIS can be used to create more effective and efficient farming techniques. It can also analyse soil data and to determine: what are the best crop to plant? where they should go? how to maintain nutrition levels to best benefit crop to plant? It is fully integrated and widely accepted for helping government agencies to manage programs that support farmers and protect the environment. This could increase food production in different parts of the world so the world food crisis could be avoided</p>	

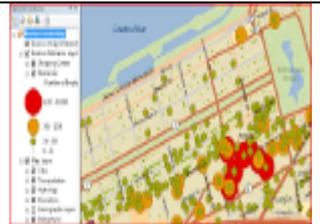

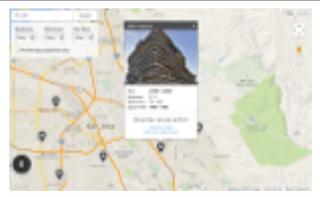

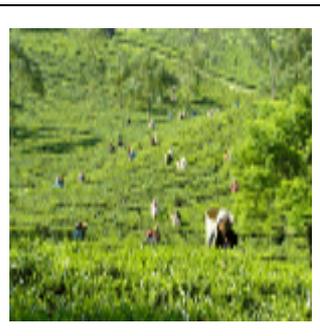

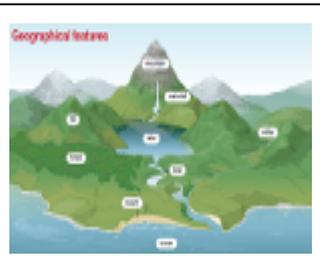

<p>1.17. Disaster Management and Mitigation: Today a well-developed GIS systems are used to protect the environment. It has become an integrated, well developed and successful tool in disaster management and mitigation. GIS can help with risk management and analysis by displaying which areas are likely to be prone to natural or man-made disasters. When such disasters are identified, preventive measures can be developed.</p>	
<p>1.18. Landslide Hazard Zonation using GIS: Landslide hazard zonation is the process of ranking different parts of an area according to the degrees of actual or potential hazard from landslides. The evaluation of landslide hazard is a complex task. It has become possible to efficiently collect, manipulate and integrate a variety of spatial data such as geological, structural, surface cover and slope characteristics of an area, which can be used for hazard zonation. The entire above said layer can well integrate using GIS and weighted analysis is also helpful to find Landslide prone area. By the help of GIS, we can do risk assessment and can reduce the losses of life and property.</p>	
<p>1.20. Determine land use/land cover changes: Land cover means the feature that is covering the barren surface .Land use means the area in the surface utilized for particular use. The role of GIS technology in land use and land cover applications is that we can determine land use/land cover changes in the different areas. Also it can detect and estimate the changes in the land use/ land cover pattern within time. It enables to find out sudden changes in land use and land cover either by natural forces or by other activities like deforestation.</p>	
<p>1.21. Navigation (routing and scheduling): Web-based navigation maps encourage safe navigation in waterway. Ferry paths and shipping routes are identified for the better routing. ArcGIS supports safe navigation system and provides accurate topographic and hydrographic data. Recently DNR, s Coastal Resources Division began the task of locating, documenting, and cataloguing these no historic wrecks with GIS. This division is providing public information that make citizens awareness of these vessel locations through web map. The web map will be regularly updated to keep the boating public informed of these coastal hazards to minimize risk of collision and injury</p>	
<p>1.22. Flood damage estimation: GIS helps to document the need for federal disaster relief funds, when appropriate and can be utilized by insurance agencies to assist in assessing monetary value of property loss. A local government need to map flooding risk areas for evaluate the flood potential level in the surrounding area. The damage can be well estimate and can be shown using digital maps</p>	
<p>1.23. Natural Resources Management: By the help of GIS technology the agricultural, water and forest resources can be well maintaining and manage. Foresters can easily monitor forest condition. Agricultural land includes managing crop yield, monitoring crop rotation, and more. Water is one of the most essential constituents of the environment. GIS is used to analyse geographic distribution of water resources. They are interrelated, i.e. forest cover reduces the storm water runoff and tree canopy stores approximately 215,000 tons carbon. GIS is also used in afforestation.</p>	

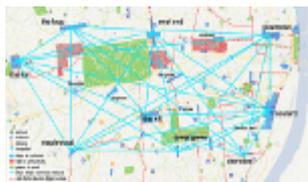

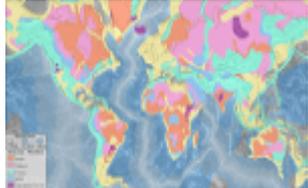

<p>1.24. GIS Solutions in Banking Sector: Today rapid development occurs in the banking sector. So it has become more market driven and market responsive. The success of this sector largely depends on the ability of a bank to provide customer and market driven services. GIS plays an important role providing planning, organizing and decision making.</p>	
<p>1.25. Soil Mapping: Soil mapping provides resource information about an area. It helps in understanding soil suitability for various land use activities. It is essential for preventing environmental deterioration associated with misuse of land. GIS Helps to identify soil types in an area and to delineate soil boundaries. It is used for the identification and classification of soil. Soil map is widely used by the farmers in developed countries to retain soil nutrients and earn maximum yield.</p>	
<p>1.26. GIS based Digital Taxation: In Local Governments, GIS is used to solve taxation problems. It is used to maximize the government income. For example, for engineering, building permits, city development and other municipal needs, GIS is used. Often the data collected and used by one agency or department can be used by another.</p>	
<p>1.27. Land Information System: GIS based land acquisition management system will provide complete information about the land. Land acquisition managements is being used for the past 3 or 4 years only. It would help in assessment, payments for private land with owner details, tracking of land allotments and possessions identification and timely resolution of land acquisition related issues</p>	
<p>1.28. Surveying: Surveying is the measurement of location of objects on the earth's surfaces. Land survey is measuring the distance and angles between different points on the earth surface. An increasing number of national and governments and regional organizations are using GNSS measurements. GNSS is used for topographic surveys where a centimetre level accuracy is provided. These data can be incorporated in the GIS system. GIS tools can be used to estimate area and also, digital maps can be prepared.</p>	
<p>1.29. Wetland Mapping: Wetlands contribute to a healthy environment and retain water during dry periods, thus keeping the water table high and relatively stable. During the flooding they act to reduce flood levels and to trap suspended solids and attached nutrients. GIS provide options for wetland mapping and design projects for wetland conservation quickly with the help of GIS. Integration with Remote Sensing data helps to complete wetland mapping on various scale. We can create a wetland digital data bank with spices information using GIS.</p>	
<p>1.30. GIS Applications in Geology: Geologists use GIS in a various application. The GIS is used to study geologic features, analyse soils and strata, assess seismic information, and or create three dimensional (3D) displays of geographic features. GIS can be also used to analyse rock information characteristics and identifying the best dam site location.</p>	

<p>1.31. Detection of Coal Mine Fires: GIS technology is applied in the area of safe production of coal mine. Coal mine have developed an information management system, the administrators can monitor the safe production of coal mine and at the same time improve the abilities to make decisions. Fire happens frequently in coal mines. So it can assessed spontaneous combustion risk using GIS tools</p>	
<p>1.32. Assets Management and Maintenance: GIS helps organizations to gain efficiency even in the face of finite resources and the need to hold down the cost. Knowing the population at risk enables planners to determine where to allocate and locate resources more effectively. Operations and maintenance staff can deploy enterprise and mobile workforce. GIS build mobile applications that provide timely information in the field faster and more accurate work order processing</p>	
<p>1.33. GIS for Planning and Community Development: GIS helps us to better understand our world so we can meet global challenges. Today GIS technology is advancing rapidly, providing many new capabilities and innovations in planning. By applying known part of science and GIS to solve unknown part, that helps to enhance the quality of life & achieve a better future. Creating & applying GIS tools and knowledge allow us integrating geographic intelligence into how we think behave.</p>	
<p>1.34. GIS in Dairy Industry: Geographic Information System is used in a various application in the dairy industry, such as distribution of products, production rate, location of shops and their selling rate. These can be monitored by using GIS system. It can be also possible to understand the demand of milk and milk products in different region. GIS can prove to be effective tool for planning and decision making for any dairy industry. These advantages have added new vistas in the field of dairy farm and management.</p>	
<p>1.35. Tourism Information System: GIS provides a valuable toolbox of techniques and technologies of wide applicability to the achievement of sustainable tourism development. This provide an ideal platform tools required to generate a better understanding, and can serve the needs of tourists. They will get all the information on click, measure distance, find hotels, restaurant and even navigate to their respective links. Information plays a vital role to tourists in planning their travel from one place to another, and success of tourism industry. This can bring many advantages for both tourist and tourism department.</p>	
<p>1.36. Irrigation water management: Water availability for irrigation purposes for any area is vital for crop production in that region. It needs to be properly and efficiently managed for the proper utilization of water. To evaluate the irrigation performance, integrated use of satellite remote sensing and GIS assisted by ground information has been found to be efficient technique in spatial and time domain for identification of major crops and their conditions,</p>	

<p>1.37. Fire equipment response distance analysis: GIS can be used to evaluate how far (as measured as via the street network) each portion of the street network is from a firehouse. This can be useful in evaluating the best location for a new firehouse or in determining how well the fire services cover particular areas for insurance ratings. (Himachal Pradesh, Development Report)</p>	
<p>1.38. Worldwide Earthquake Information System: One of the most frightening and destructive phenomena of nature is the occurrence of an earthquake. There is a need to have knowledge regarding the trends in earthquake occurrence worldwide. A GIS based user interface system for querying on earthquake catalogue will be of great help to the earthquake engineers and seismologists in understanding the behaviour pattern of earthquake in spatial and temporal domain.)</p>	
<p>1.39. Volcanic Hazard Identification: Volcanic hazard to human life and environment include hot avalanches, hot particles gas clouds, lava flows and flooding. Potential volcanic hazard zone can be recognized by the characteristic historical records of volcanic activities, it can incorporate with GIS. Thus an impact assessment study on volcanic hazards deals with economic loss and loss of lives and property in densely populated areas.</p>	
<p>1.40. Energy Use Tracking and Planning: GIS is a valuable tool that helps in the planning organizing and subsequent growth in the energy and utilities industries. The effective management of energy systems is a complex challenge. GIS has enormous potential for planning, design and maintenance of facility. Also it provides improved services and that too cost effectively.</p>	
<p>1.41. GIS for Fisheries and Ocean Industries: GIS tools add value and the capability to ocean data. ArcGIS is used to determine the spatial data for a fisheries assessment and management system. It is extensively used in the ocean industry area and we get accurate information regarding various commercial activities. To enhance minimizing cost for the fishing industry. Also it can determine the location of illegal fishing operations.</p>	
<p>1.42. Monitor Rangeland Resources: GIS is a valuable tool used to monitor the changes of rangeland resource and for evaluating its impact on environment, livestock and wild life. Accurate observation and measurements are to be made to find out the changes in the rangeland conditions. GIS is also used to monitoring ecological and seasonal rangeland conditions</p>	
<p>1.43. Reservoir Site Selection: GIS is used to find a suitable site for the dam. GIS tries to find best location that respect to natural hazards like earthquake and volcanic eruption. For the finding of dam site selection, the factors include economic factors, social considerations, engineering factors and environmental problems. This all information is layered in the GIS.</p>	

<p>1.44. Forest Fire Hazard Zone Mapping: Forest is one of the important element of the nature. It plays an important role in the local climate. Forest fires caused extensive damage to our communities and environmental resource base. GIS can effectively use for the forest fire hazard zone mapping and also for the loss estimation. GIS also help to capture real time monitoring of fire prone areas. This is achieved by the help of GNSS and satellite Remote Sensing</p>	
<p>1.45. Pest Control and Management: Pest control helps in the agricultural production. Increasing in the rate of pest and weeds can lead to decrease in the crop production. Therefore, GIS plays an important role to map out infested areas. This leads in the development of weed and pest management plan.</p>	
<p>1.46. Traffic Density Studies: GIS can effectively use for the management of traffic problems. Today’s population along with the road traffic is increasing exponentially. The advantage of GIS makes it an attractive option to be used to face the emerging traffic problems. By creating an extensive database that has all the traffic information such as speed data, road geometry, traffic flow and other spatial data and processing this information will provide us the graphical bigger picture for the traffic management.</p>	
<p>1.47. Deforestation: Nowadays forest area is decreasing every year, due to different activities. GIS is used to indicate the degree of deforestation and vital causes for the deforestation process. GIS is used to monitor deforestation</p>	
<p>1.48. Space Utilization: GIS helps managers to organize and spatially visualize space and how it can best be used. Operational costs can be decreased by more efficiently using space including managing the moves of personal and assets as well as the storage materials. The 3D visualization in GIS platforms helps planers to create a feeling of experience like virtual walk inside the building and rooms before construction.</p>	
<p>1.49. Desertification: Desertification is the land degradation due to climatic variations or human activities. GIS can provide the information of degraded land which can be managed by governmental agencies or by the communities themselves. GIS plays a vital role to reduce the desertification, the local governments are now widely depends on GIS for reducing desertification. With location based GIS analysis we can find where or which area is suitable for planting new vegetation and which area for the pipeline construction</p>	
<p>1.50. Disaster and Business Continuity Planning: Viewing building and locations assets along with emergency information such as weather patterns, and disaster zones, can provide organizations the required information to make better decision. GIS provide holistic understanding of facility status and performance, and brings together department, business systems, and data source for a comprehensive view into and throughout the organization.</p>	

<p>1.51. GIS for Business: GIS is also used for managing business information based on its location. GIS can keep a track of where the customers are located, site business, target marketing campaigns, and optimize sales territories and model retail spending patterns. Such an added advantage is provided by the GIS to enhance in making companies more competitive and successful.</p>	
<p>1.52. Utilities: The GIS is used for different type of utilities like electricity, telecom and cooking gas on a daily basis and utilities to help them in mapping, in inventory systems, track maintenance, monitor regulatory compliance or model distribution analysis, transformer analysis and load analysis.</p>	
<p>1.53. Lease Property and Management: Revenue can be increased, operations and maintenance cost can be reduced when GIS is used to help manage space. Real estate and property managers can see and make queries about space including its availability, size and special constraints for the most cost effective use.</p>	
<p>1.54. Development of Public Infrastructure Facilities: GIS has many uses and advantages in the field of facility management. GIS can be used by facility managers for space management, visualization and planning, emergency and disaster planning and response. It can be used throughout the life cycle of a facility from deciding where to build to space planning.</p>	
<p>1.55. GIS for Drainage Problems in Tea Plantation Areas: Drainage problem in tea plantation differ widely because of its varied nature of physical conditions. Tea crop requires moisture at adequate levels all times of its growth. Any variation either excess or lack has a direct impact on the tea yield. This become greatly influenced the productivity of tea. Required some hydraulic design to solve this problem such as design of drains, checking the adequacy of the river and classification of water logged areas etc. GIS helps to reduce the water logging by establishing well developed plans.</p>	
<p>1.56. Collection of Information about Geographic Features: GIS is not simply a computer system used for making maps. A map is simply the most common way of reporting information from a GIS database. So these systems are not only for creating maps but also most importantly the collection of information about the geographic features such as building, roads, pipes, streams, ponds and many more that are located in your community.</p>	
<p>1.57. GIS for Public Health: GIS provides the cost effective tool for evaluating interventions and policies potentially affecting health outcomes. GIS analysis, environmental health data is also helpful in explaining disease patterns of relationships with social, institutional, technological and natural environment. It can be understanding the complex spatial temporal relationship between environmental pollution and disease, and identifying exposures to environmental hazards.</p>	

<p>1.58. Location Identification: This technique is used to find a location for a new retail outlet. It helps to find out what exists at a particular location. A location can be described in many ways, using, for instance, name of place, post code, or geographic reference such as longitude or latitude or X/Y.</p>	
<p>1.59. Knowledge Based System for Defence Purpose: Regular analysis of terrain is essential for today’s fast paced battlefield. Conventional method of studying paper topographical maps is being replaced by use of maps in digital form to get terrain information. It is increasingly being used to derive terrain information from digital images. Which help to the selection of suitable sites for various military uses more accurate and faster. The uses of GIS provide information regarding the terrain features which can be useful for planning today’s war strategies.</p>	
<p>1.60. Pipeline Route Selection: Pipeline route planning and selection is usually a complex task. GIS technology is faster, better and more efficient in this complex task. Accurate pipeline route selection brings about risk and cost reduction as well as better decision making process. GIS least cost path analysis have been effectively used to determine suitable oil and gas pipeline routes. An optimal route will minimize reduce economic loss and negative socio-environmental impacts.</p>	
<p>1.61. Producing Mailing Labels for abutter Notification: Zoning board of appeals hearings or proposed action by a town or city require notifying abutting property owners. A GIS application for producing abutter mailing labels enables you to identify abutting property owners are in different ways. Once the properties are identified this kind of GIS applications can produce mailing labels and be integrated with a word processing “mail merge “capabilities.(http://www.mass.gov/)</p>	
<p>1.62. Site Suitability for Waste Treatment Plant: There is an increasing amount of waste due to the over population growth. This has negative impact on the environment. With the help of GIS we can integrate various aspect layers in GIS and can identify which place is suitable for waste treatment plant. This process will reduce the time and it is cost effective. Also it enhances the accuracy. It provides a GIS analyst to identify a list of suitable dumping sites for further investigations. It also provides a digital bank for future monitoring program of the site.</p>	
<p>1.63. Geologic Mapping: GIS is an effective tool in geological mapping. It becomes easy for surveyors to create 3D maps of any area with precise and desired scaling. The results provide accurate measurements, which helps in several field where geological map is required. This is cost effective and offers more accurate data, there by easing the scaling process when studying geologic mapping</p>	
<p>1.64. Environment: The GIS is used every day to help protect the environment. The environmental professional uses GIS to produce maps, inventory species, measure environmental impact, or trace pollutants. The environmental applications for GIS are almost endless.</p>	

<p>1.65. Infrastructure Development: Advancement and availability of technology has set a new mark for professionals in the infrastructure development area. Now more and more professionals are seeking help of these technologically smart and improved information systems like GIS for infrastructure development. Each and every phase of infrastructure life cycle is greatly affected and enhanced by the enrolment of GIS.</p>	
<p>1.66. Coastal Development and Management: The coastal zone represents varied and highly productive ecosystem such as mangrove, coral reefs, sea grasses and sand dunes. GIS could be generating data required for macro and micro level planning of coastal zone management. GIS could be used in creating baseline inventory of mapping and monitoring coastal resources, selecting sites for brackish water aquaculture, studying coastal land forms.</p>	
<p>1.67. Crime Analysis: GIS is a necessary tool for crime mapping in law enforcement agencies worldwide. Crime mapping is a key component of crime analysis. Satellite images can display important information about criminal activities. The efficiency and the speed of the GIS analysis will increase the capabilities of crime fighting.</p>	
<p>1.68. River Crossing Site Selection for Bridges: The important geotechnical consideration is the stability of slope leading down to and up from the water crossing. It is advisable to collect historical data on erosion and sedimentation. On the basis of these information assess the amount of river channel contraction, degree of curvature of river bend, nature of bed and bank materials including the flood flow and the flow depth, all these can be done in GIS within estimated time and accurately. This information has been often used for river crossing site selection for bridges.</p>	
<p>1.69. Land Use Changes Associated with Open Cast Strip Mining: Mining is the back bone of the developing economy of any country. Mapping, monitoring and controlling the impact caused by the mining activities is necessary so as to understand the character and magnitude of these hazardous events in an area. The data required to understand the impact of mining from the environment is coming from different discipline, which need integration in order to arrive hazard map zonation</p>	
<p>1.70. Economic Development: GIS technology is a valuable tool used for the economic development. It helps in site selection, suitability analysis, and for finding the right sites to locate new business and grow existing ones. Within economic development, GIS is used to support the emerging trend of economic gardening, a new way to foster local and regional economic growth by existing small business in the community.</p>	
<p>1.71. School Student Walking Distance Analysis: If your community buses students to school, but only if they lived beyond a certain distance from their school, this can be used to determine what addresses are eligible for busing.</p>	

<p>1.72. Locating Underground Pipes and Cables: Pipe line and cable location is essential for leak detection. It can be used to understand your water network, conducting repairs and adjustments, locating leaks known distance for correlating etc. Pipelines are continually monitored, check for leak detection and avoid the problem of geo hazards.</p>	
<p>1.73. Coastal Vegetation Mapping and Conservation: Coastal vegetation like Mangroves are the protectors of coast from natural hazards like tsunami, so that the conservation of these vegetation are highly important. GIS enable us to map which are having higher density of vegetation and which area need more vegetated? Integration of these details to coastal zone mapping helps to identify the area prone to coastal erosion and we can plant more vegetation to reduce coastal erosion.</p>	
<p>1.74. Regional Planning: Every day, planners use Geographic Information System (GIS) technology to research, develop, implement, and monitor the progress of their plans. GIS provides planners, surveyors, and engineers with the tools they need to design and map their neighbourhood's and cities. Planners have the technical expertise, political savvy, and fiscal understanding to transform a vision of tomorrow into a strategic action plan for today, and they use GIS to facilitate the decision-making process. (ESRI, GIS Solutions for Urban and Regional Planning</p>	
<p>1.75. GIS for Land Administration: In a number of countries, the separate functions of land administration are being drawn together through the creation of digital cadastral databases, with these database they can reuse land for suitable needs ,digital taxation and even utilities are also easily handle using these database</p>	
<p>1.76. Snow Cover Mapping and Runoff Prediction: Systematic, periodical and precise snow cover mapping supported by GIS technology, and the organization of the results in a snow cover information system forms the basis for a wide range of applications. On the practical side, these applications are related to the monitoring of seasonal and yearly alterations of the snow cover under the presently existing climatic conditions, to simulate and forecast runoff, to map the regional distribution of the water equivalent, and to document the recession process of the snow cover during the melting period in its relation to geological features.</p>	
<p>1.77. GIS for Wildlife Management: Man made destruction such as habitat loss, pollution, invasive species introduction, and climate change, are all threats to wildlife health and biodiversity. GIS technology is an effective tool for managing, analysing, and visualizing wildlife data to target areas where international management practices are needed and to monitor their effectiveness. GIS helps wildlife management professionals examine and envision.</p>	

2. GIS- Application in Transportation:

The transport sector is one of the backbones of a country's economy. It's through transport systems that goods and people can move as they go about their social and economic activities. Automation of

most tasks has been witnessed not only in industries but also in transport. Geographic information systems is a computer system used in highway maintenance, accident analysis, route planning, environmental assessment, and transport safety as well as construction management. The following are thus the description of some of the applications of GIS in transportation.

2.10. Highway maintenance:

Highway maintenance has over the last few years become easy and cost-effective due to the introduction of geographic information System. Satellites can take images about highways on a real-time basis, which shows the critical areas that are experiencing challenges. Various maps are also availed by GIS digitally to the government and relevant authorities for decision making. Information about highway structures can be feed into GIS databases and accessed from any place.

2.11. Accident Analysis:

CCTV in most cities and towns, as well as satellites imaging services, is easy to integrate with GIS. Location addressing is used to raise the alarm to accident emergency responders to offer help. GIS can act as a source of a report in the event of an accident.

2.12. Traffic Modelling:

Most cities in the world are full of vehicles. Failure by the government to effectively manage traffic leads to heavy congestion and traffic jams, which are difficult to keep up with. Following the significant changes being made in the world of computer technology, most countries are migrating to the use of computer systems for traffic management and structure design. GIS has offered great solutions on traffic management for the different vast road networks available in cities and towns. This has proved to ease congestion by as only the best designs of road, rail and air are constructed. GIS does not only monitor these transport systems during construction but also offers surveillance and visualization of traffic after they are built.

2.13. Route planning:

When a proposal is made to construct new roads or railway lines, field experts must approve the routes on which the developments are to be laid out. Longer routes are to add more resource consuming and make travel time to increase, for example with roads and railways drastically. Road and rail engineers must navigate road or rail routes via the shortest and most efficient paths. Longer routes deprive the citizen or user of the road money as much of the expenses go on fuel costs. Efficient, secure, and shorter paths must, therefore, be realized. Its, however difficult to determine the best route if manual methods are used. GIS is best to apply in such instances as drainage, soil properties, and the sloppiness of land is easy to determine. This is thus one of the commonly performed tasks by GIS on infrastructure. It's also easier to come with route designs and models when using GIS.

2.14. Environmental Impact Assessment:

Roads, railways, ports, and airports are usually built on the land. The existence of some structures that are put along with transportation amenities may have consequences on human life or that of wildlife. A good example is the construction of a highway or railway across a game park or very near to a water body. The environment is thus a factor that must be considered as it offers the habitat for both human beings and other living organisms. GIS comes to offer help as predictions on what would happen if a given infrastructure is started in a specific location are expounded. Pipelines are sometimes viewed as a mode of transport for petroleum products. Leakages from pipelines cause the death of aquatic animals. Transportation of petroleum and its products through pipelines is thus also another task undertaken with proper integration of GIS as the environment would suffer the most in case some things went wrong.

2.15. Construction management:

During the construction of airports, structure simulations must be performed using GIS related software before actual construction. Three dimension pictures are part of the design and modelling process. During construction, drone technology can be integrated with GIS to help in visualizing ongoing construction. Errors can then be corrected, and a wide of land properties feed into GIS for further planning. GIS is also used to enable the creation of design templates that explain a prospective project like a highway, airport, or port.

2.16. Transport safety management:

Information from different transport structures is beneficial to help formulate regulations and inform the public on how to use certain transport facilities. Crossing points can have integration with GIS for better signalling of drivers and people trying to crossroads or even railway crossing points. Places considered to be black spots and prone to accidents are also studied using GIS to determine the causes of accidents. This is thus very beneficial to any country.

3. Conclusions:

- 3.10. Better decision made by government people
- 3.11. Improve decision making with the help of layered information
- 3.12. Citizen engagement at mass level due to better system
- 3.13. Help to identify communities that is under risk or lacking infrastructure
- 3.14. Helps in identifying criminology matters
- 3.15. Better management of natural resources
- 3.16. Better communication during emergency situation
- 3.17. Time and Cost savings due to better decision
- 3.18. Finding different kinds of trends within the community
- 3.19. Planning the demographic changes
